Your hours notebook, checked in minutes

A worked example on your own two notebook pages · 22 Sep – 20 Oct 2026 · 80 THB/hour

Total written in the notebook	What the daily entries add up to	Missing from the notebook total
109 h	**120 h**	**11 h**
8,720 THB	9,600 THB	880 THB

What was found

Every daily entry in the notebook is consistent: start time, finish time and the written hours agree on all 22 shifts. The mistake is only in the adding-up at the bottom of the page.

The running total reaches exactly 109 hours on 17 October. The last two shifts, **18 Oct (5h)** and **20 Oct (6h)**, were left out of the total.

If 8,720 THB was paid for this period, 880 THB is still owed.

How it works

1. **Photograph** the notebook pages with a phone.
2. **AI reads** each page twice, independently.
3. **Automatic checks** compare the readings and test the arithmetic of every row.
4. **You get** a spreadsheet and a PDF with the photo beside the numbers, ready to sign.

Why this is reliable when a chatbot alone is not

Asking a chat assistant to “read this page and add it up” gives one answer with nothing checking it. Handwriting gets misread and sums drift, and you cannot tell when. Here the AI only does the reading. The notebook then checks itself, because each row carries three numbers that must agree:

Check	What it catches
Two independent readings agree	A digit the AI misread
Finish minus start equals the written hours	A misread time, or a slip by whoever wrote it
Dates run in order, closed days are all Mondays	A skipped row, or rows shifted by a day
Every shift is a sensible length	Unreadable or impossible values
Notebook's grand total equals the sum of the days	Adding-up mistakes, like the 11 hours above

If any check fails, the record is marked NOT VERIFIED and names the row to look at. Six kinds of deliberately planted error were tested; all six were caught.

What it takes to use every pay period

- Phone photos of the pages, one small settings file (start date, rate, staff name), two commands.
- About a minute per pay period. AI usage cost is estimated at roughly 10 THB or less per period.
- Pay is shown both ways, clearly labelled: hours as written by staff (120h 00m, 9,600.00 THB) and exact clock time (119h 59m, 9,598.67 THB). You choose which to pay.
- The notebook stays. Nobody has to change how they record hours.

Attached: **payroll.xlsx** (the record) and **report.pdf** (checks, daily record, photo evidence, signature lines). The signatures confirm the hours were worked; the checks confirm the numbers.
